The Log Cowboy project is a web-based logging system, for the Head of Life Sciences department at Victoria University. The Log Cowboy is designed to allow the lecturers and tutors log information about classes and labs. The Log Cowboy has been coded in PHP and uses a MySQL backend for the database.

**Functionality**
The Log Cowboy lets staff connect to a web-based system. From there they can create and view logs. Once done they can logout.

**Usability**
With its features and its streamlined interface combined flawlessly, the Cowboy does the job, without the user needing to have a Degree in Computer Science.

**Purpose**
In the past Lecturers have hand-written notes scribbled on scraps of paper that are filed in boxes never to be seen again.

This system allows the staff to store their notes electronically, in a place where they can write them and read them with ease.

Conforming with standards and developing an interface that anyone can use easily was paramount.

Group 26 would like to thank the following people: Our Supervisors, Dr Hao Shi, Chris Charalambous and Liz Haywood. Our client Michelle Towstoless. The Lecturers: Donna Dwyer, Fernando Scamozino Technical Support: Mark Mojic Victoria University. And all the other Project Groups.
